

Labelbox instructions for image annotation

Criteria to have into account:

- Try to avoid objects in front, and fire as much as possible.
- Annotate multiple instances of smoke, if there's the case, in one image (main body).

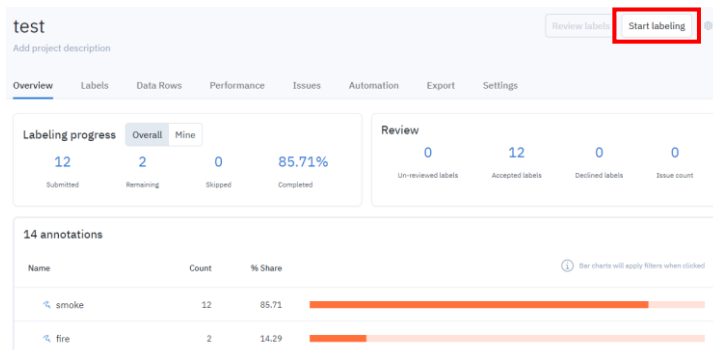

1. Once you have received the invitation mail and joined on the Labelbox group, enter to the corresponding project (in this example "test" but we will be working on the "smoke_annotation").

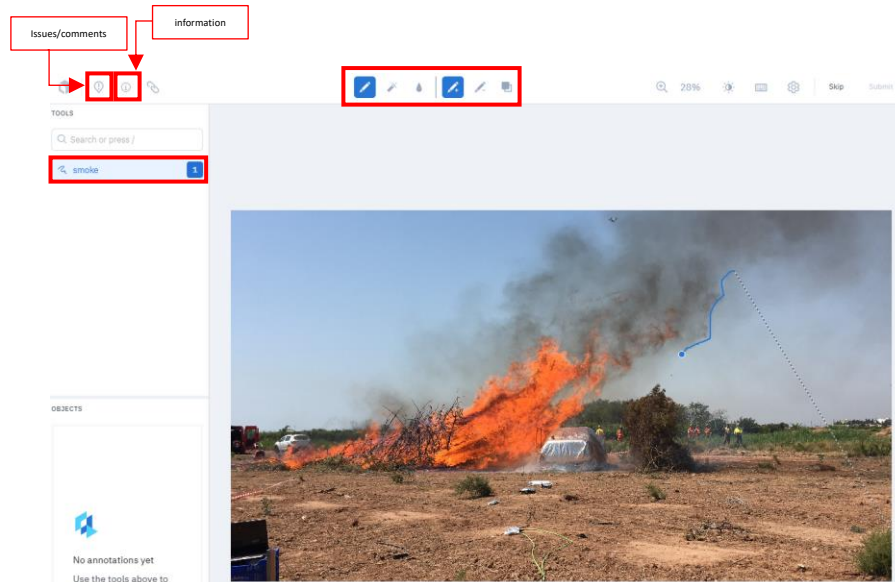

The screenshot shows the Labelbox web interface at app.labelbox.com/projects. It features a navigation bar with 'Annotate', 'Model', 'Catalog', and 'Schema' tabs. A search bar is present, and a table lists projects. The 'smoke_annotation' project is highlighted with a red box.

Project name	Labels	Updated ↑	Tag
test	13	44 minutes ago	
smoke_annotation	0	about 1 hour ago	
test1	14	about 2 hours ago	

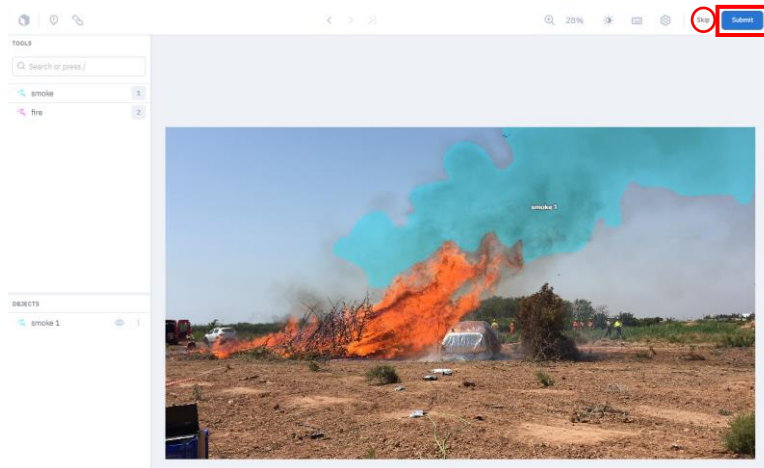

2. This is the main page of the Labelbox app, in the labelling progress box it can be seen the labels already done and the ones missing for the overall Project, and also for each annotator. To start labelling just click in the "Start labelling" button.

3. This is the labelling editor, to create a mask
 - a. To create a mask, click in the label "smoke", and with the pen draw the mask around the smoke. You can do it by free hand (keep permanent click on the mouse to draw) or by joining different points with lines (click on each point)
 - b. To zoom in → Z + right click on mouse or with the mouse scroll.
 - c. To zoom out → Alt + Z + right click on mouse or with the mouse scroll.
 - d. If there is any issue, problem or comments regarding the image labelling, click on the "Issues" button , write down the comments and "create issue".
 - e. There's also an information file available on  button.

- Once the labelling is completed, click submit. In the other hand, if for any reason the image cannot be labelled, click skip.

- If afterwards there's a need to change any label, go to the "Labels" page and click on the file name to change.

	smoke_(854).jpg	about 2 hours ago	alba.baldich@gmail.com	+2	97%	45s	25s	No

6. You are now again on the Label editor (instructions in point 3), remember that to edit the existing label, you have to click the object to edit it before (“smoke1” in this example) then click the pen and modify it, if not it will be created on a new object label. Once it’s modify it, you need to save it.

If there's any question or problem just contact me and I will help you or write it down on the "Issues" comments (point 3 - d).

Thanks for your support!
